

This example shows that the trail and error method may not provide us the max-flow in a network.

Problem: To find the maximum flow through the given network.

Let us try to solve the network flow problem by simple guessing.

The total flow is the bottle-neck of the path $S - A - B - t = 20$. No other path is available from S to t. Thus, we get max-flow= 20.

Now, this time we first consider the path S-A-t,

The capacity of the path is 10.

Next, choose the path S-A-B-t.

Path	Flow amount
S-A-t	10
S-A-B-t	10
S-B-t	10
Total	30

Finally, choose the path S-B-t.

Therefor the maximum flow is 30.

Conclusion: The trial-and-error method may not provide us the optimum result. Whereas the Ford-Faulkerson method guaranties the optimum result
