LECTURE - 1

*mean value theorem [Rolle's Theorem,
Lagrange's and
and
Cauchy MVT(Chapter-8.1 & 8.2)*

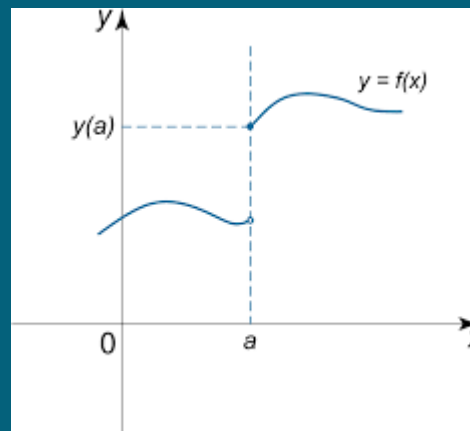

Outline

- Preliminary
- Rolle's theorem and geometrical interpretation
- Examples and counterexamples
- Lagrange's Mean Value Theorem and its interpretation
- Cauchy mean value theorem and its interpretation
- Implications
- Applications

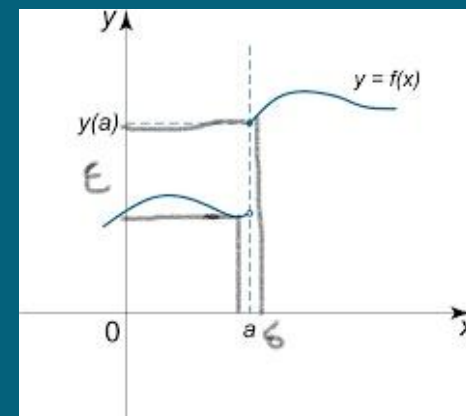

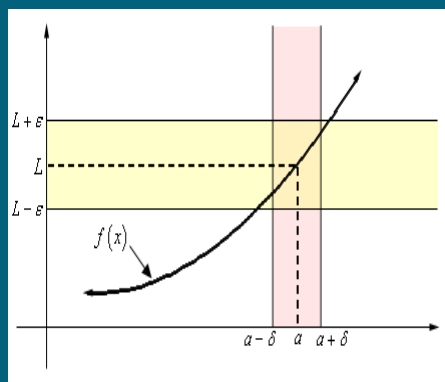

Definition: A function is continuous at point 'a' if for every small $\varepsilon > 0$ there exist $\delta > 0$ such that for all x $|x - a| < \delta$ implies $|f(x) - f(a)| < \varepsilon$.

continuous function

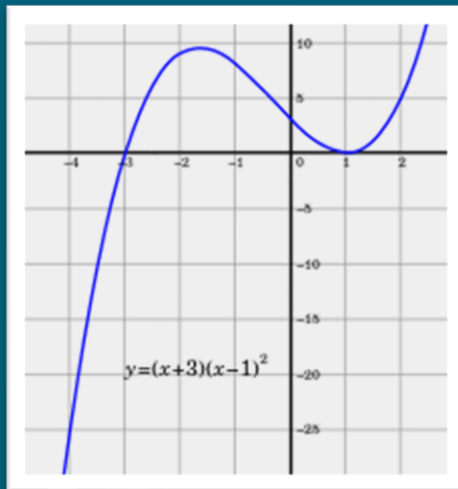

non-continuous function

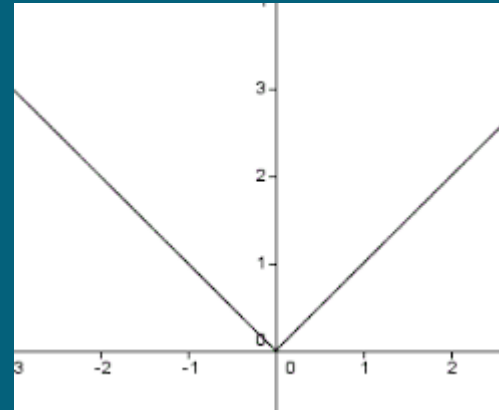

A function is differentiable at a point 'a' if the derivative

$$\lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} \text{ exists.}$$

Differentiable function

Non differentiable
function

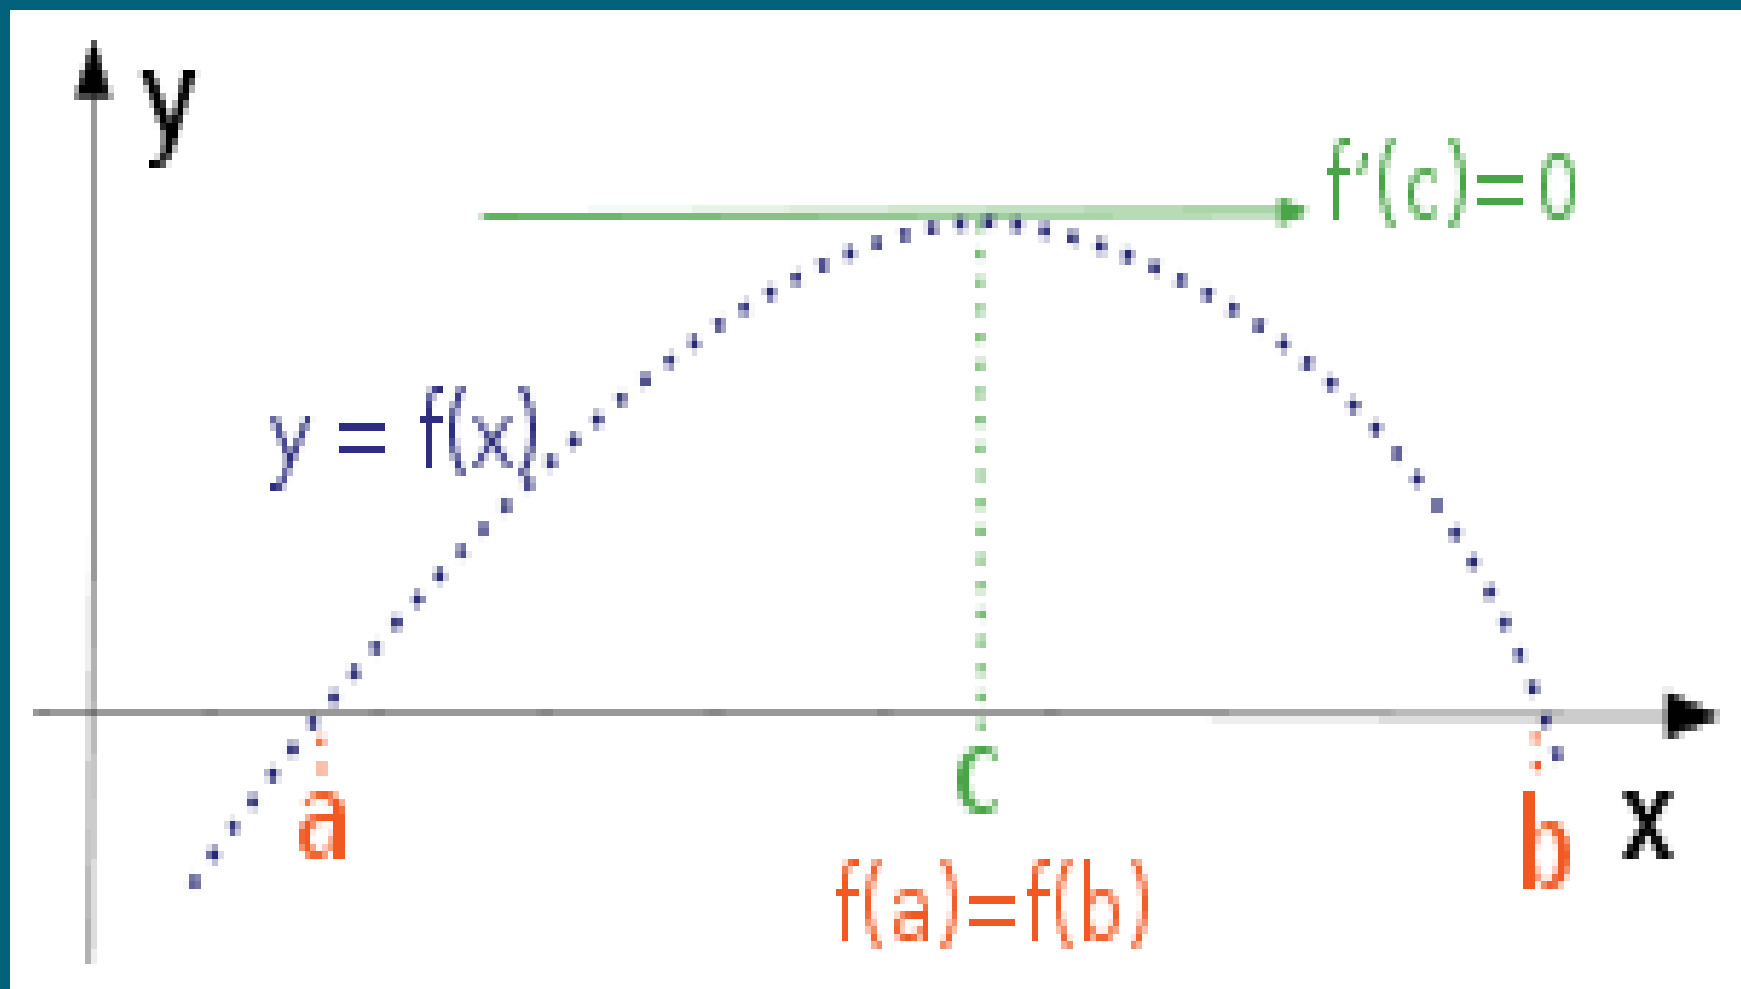

Rolle's Theorem

Statement

If a real valued function $f(x)$ is

- (i) continuous in a closed interval $[a, b]$,
- (ii) derivable in an interval (a, b) , and
- (iii) $f(a) = f(b)$,

then there exist at least one value $c \in (a, b)$ such that $f'(c) = 0$.

Solved Problems

Ex-1: Verify Rolle's theorem for

$$f(x) = x(x+3)e^{-x/2} \quad \text{in } [-3, 0].$$

Solution

Let $f(x) = x(x+3)e^{-x/2}$, $x \in [-3, 0]$.

so that $f(-3) = 0 = f(0)$.

Also the function is derivable in the interval $[-3, 0]$.

We have $f'(x) = (2x+3)e^{-x/2} + x(x+3)e^{-x/2} \left(-\frac{1}{2}\right)$

$$= \frac{(-x^2 + x + 6)}{2} e^{-x/2}$$

Now $f'(x) = 0 \Leftrightarrow -x^2 + x + 6 = 0$.

The equation $-x^2 + x + 6 = 0$ is satisfied by $x = -2, 3$.

Of these two values of x for which $f'(x)$ is zero, -2 belongs to the open interval $(-3, 0)$ under consideration. Hence the verification.

Ex-2: Discuss applicability of Rolle's Theorem to the function $f(x) = |x|$ in $[-1, 1]$.

The function $f(x)$ is continuous but not differentiable in the entire open interval $(-1, 1)$ and so Rolle's Theorem is not applicable to the given function $f(x)$ in $[-1, 1]$

Lagrange's Mean Value Theorem

If a function f is

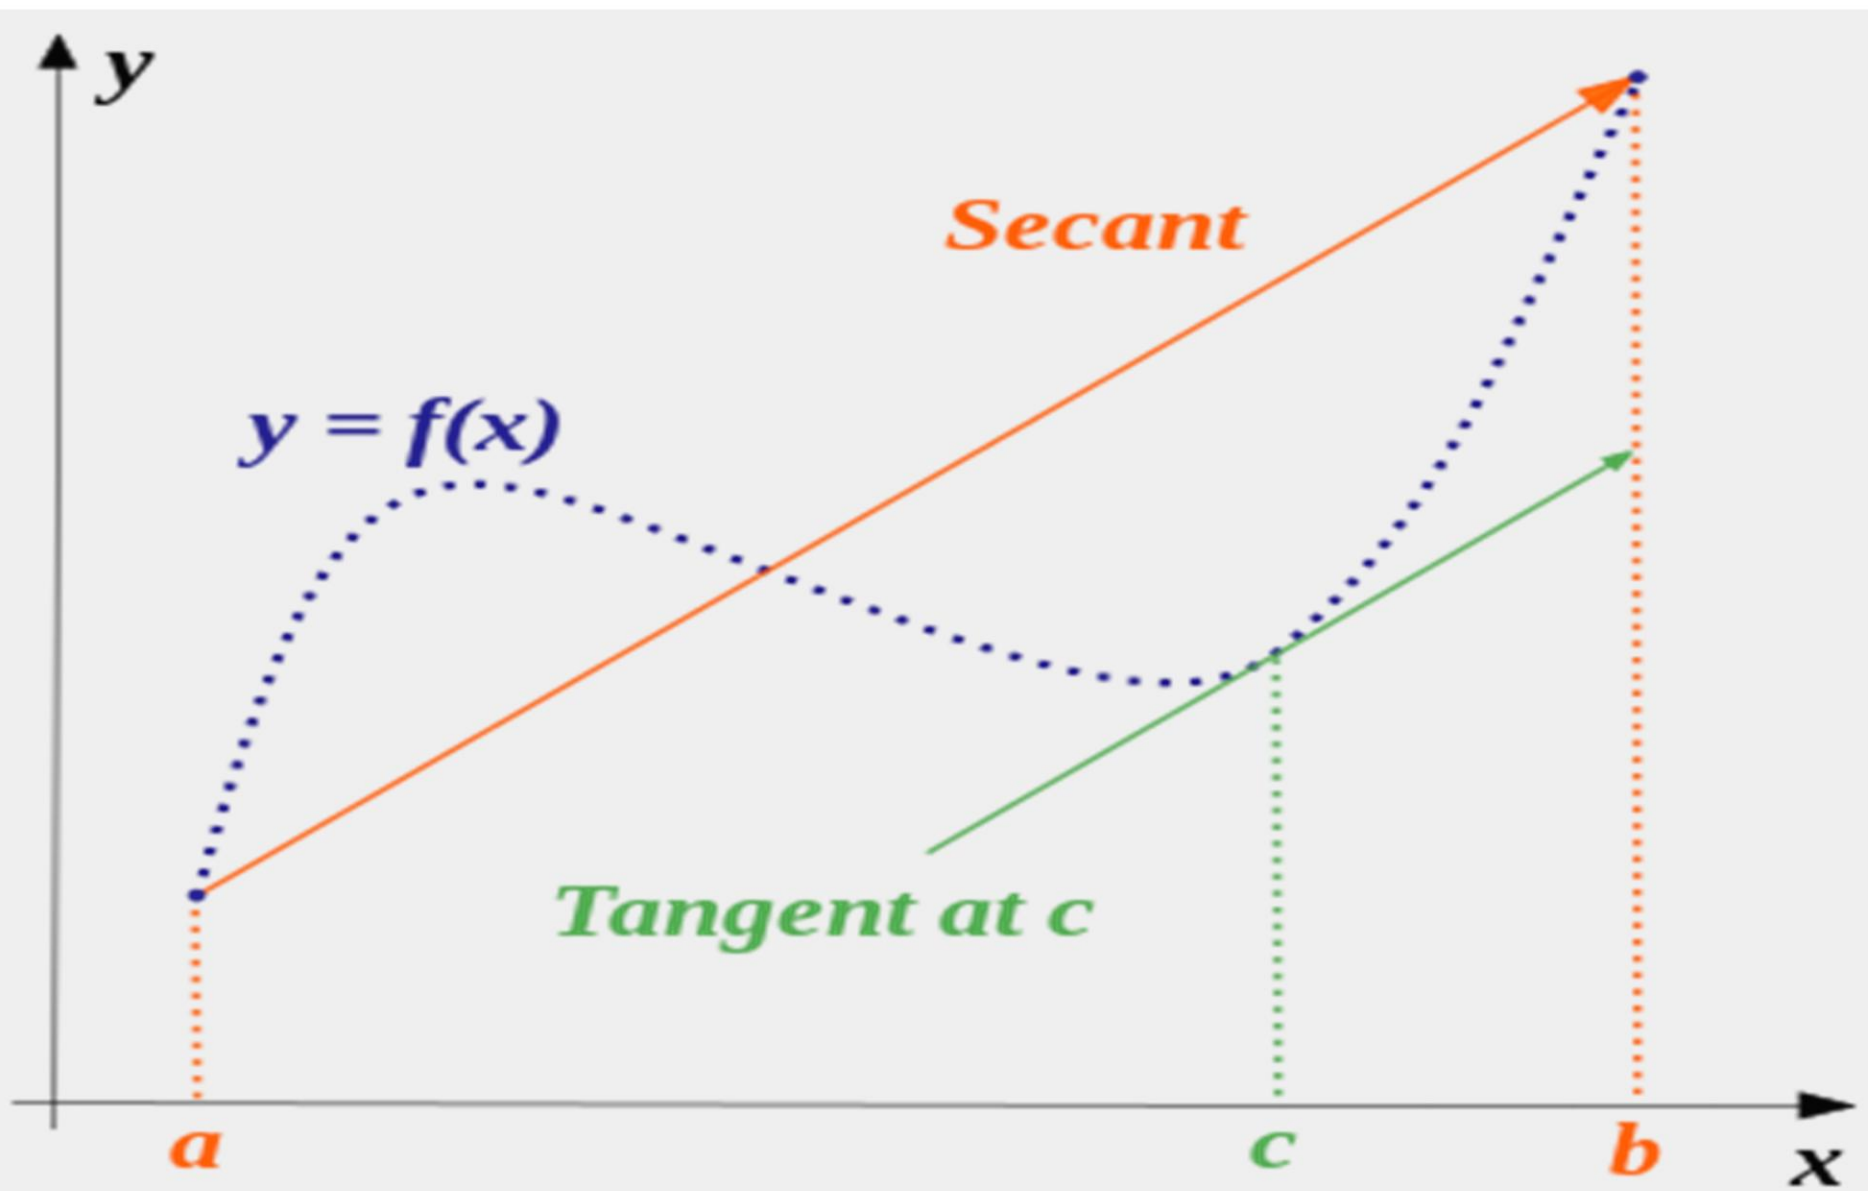

(i) Continuous in a closed interval $[a, b]$ and

(ii) derivable in the open interval (a, b) ,

then there exists at least one value $c \in (a, b)$ such that

$$\frac{f(b) - f(a)}{b - a} = f'(c)$$

Geometrical interpretation

Ex-1: Find 'c' of the mean value theorem, if

$$f(x) = x(x-1)(x-2); \quad x \in [0, \frac{1}{2}]$$

Solution $f(x) = x(x-1)(x-2) = x^3 - 3x^2 + 2x$.
 f is a polynomial function. So, it is continuous and derivable for all x .

$$a = 0, \quad b = \frac{1}{2};$$

$$f(a) = f(0) = 0, \quad f(b) = f\left(\frac{1}{2}\right) = \frac{3}{8}$$

The conditions of Lagrange's mean value theorem are satisfied.

$$\text{Also,} \quad f'(x) = 3x^2 - 6x + 2$$

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

$$\Rightarrow 3c^2 - 6c + 2 = \frac{\frac{3}{8} - 0}{1/2} = \frac{3}{4}$$

$$12c^2 - 24c + 5 = 0$$

$$\Rightarrow c = \frac{6 \pm \sqrt{21}}{6}$$

$$\text{Since } \frac{6 + \sqrt{21}}{6} \notin (0, 1/2)$$

$$\text{the required } c = \frac{6 - \sqrt{21}}{6}.$$

Cauchy Mean Value Theorem

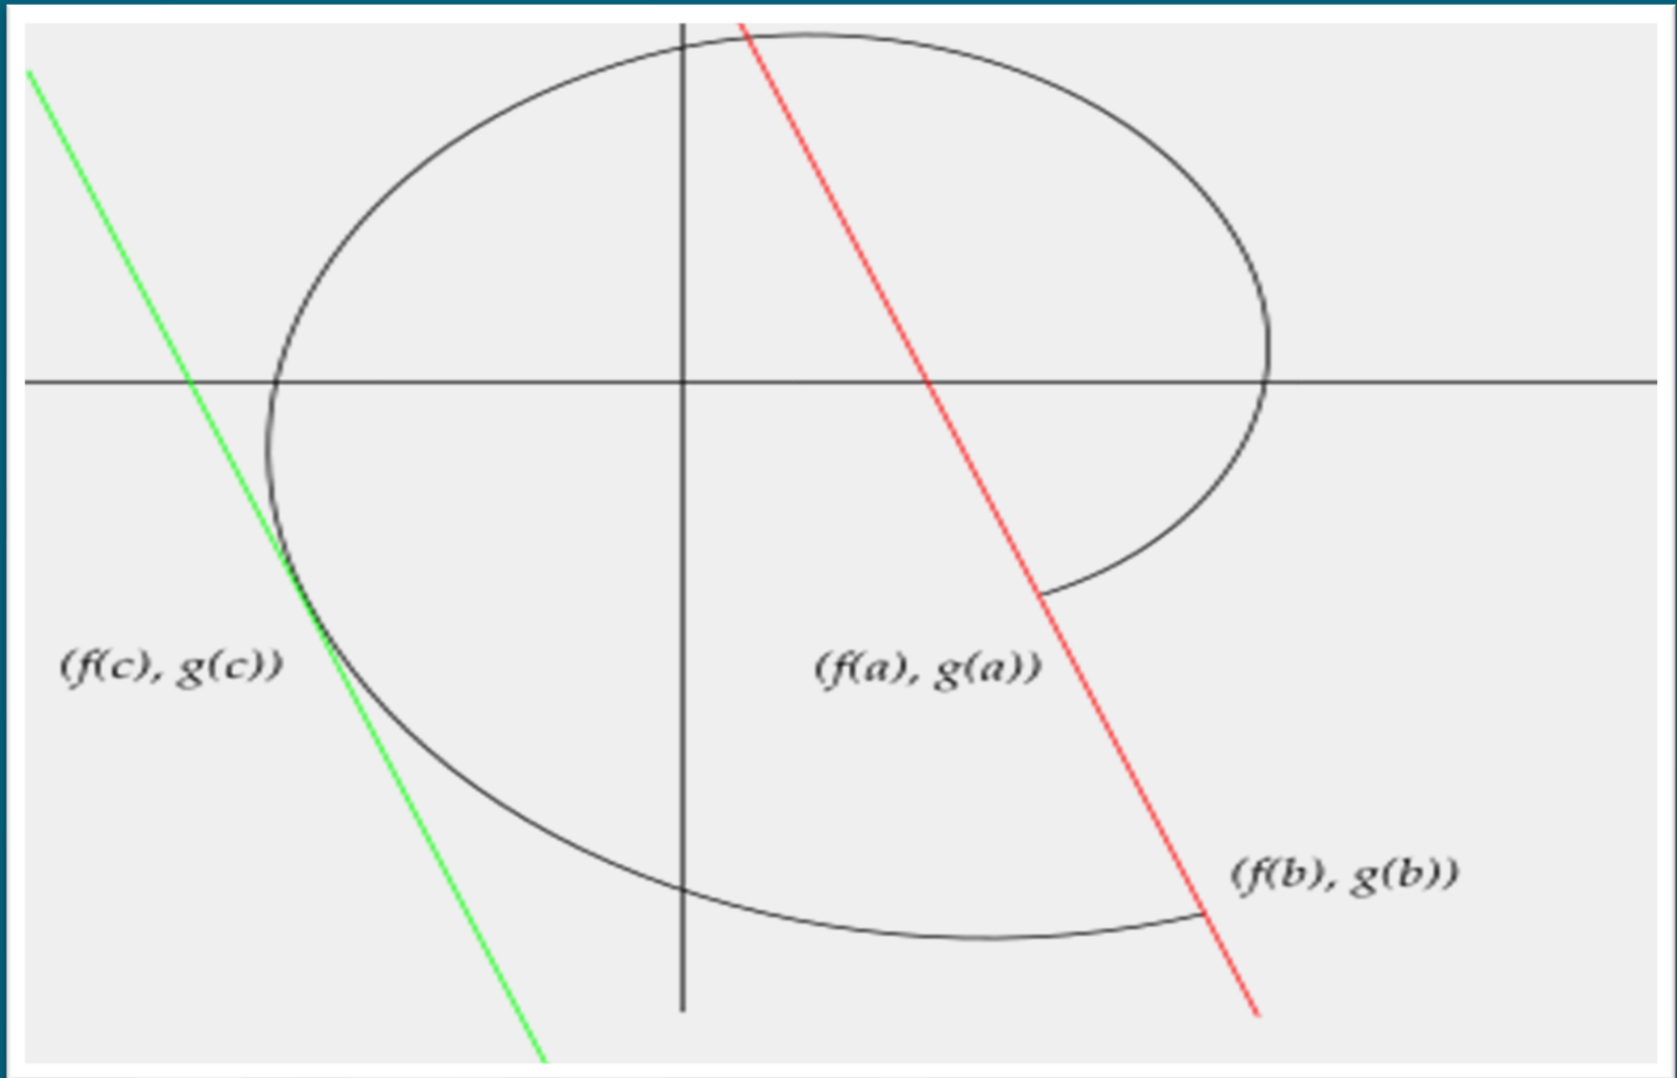

If two functions $f(x)$ and $g(x)$ are

- (i) continuous in a closed interval $[a, b]$,
- (ii) derivable in an interval (a, b) , and
- (iii) $g'(x) \neq 0$ for all $x \in (a, b)$,

Then there exists at least one $c \in (a, b)$ such that

$$\frac{f(b) - f(a)}{g(b) - g(a)} = \frac{f'(c)}{g'(c)}$$

Cauchy Mean Value Theorem

Implications

- $F'(x)=0$ for all x implies the function F is constant.

Proof: $F'(x) = 0 = \frac{F(b)-f(a)}{b-a} \Rightarrow F(a) = F(b) \Rightarrow F$ is constant.

- If $F'=G'$ for all x implies $F=G+c$, where c is a constant.

Proof: Let $H=F-G$ then $H'=F'-G'=0 \Rightarrow F=G+c$.

- $F'(x)>0$ for all x implies the function is strictly increasing.
- $F'(x)<0$ for all x implies the function is strictly decreasing.

- Proof: let us assume that there exists a and b such that $a < b$ but $f(a) > f(b) \implies f(b) - f(a) < 0$ but $b - a > 0$ so $f'(c) < 0$. Hence a contradiction. Similar proof follows for second case.

Application

- If the distance between place A and place B is 50 kms. In between the speed limit is 30 kms/hour. If a driver covers the distance in an hour then there is at least a point where the driver's speed was more than the speed limit.

The background is a solid teal color. At the top, there are several thin, wavy lines in shades of blue and teal, creating a decorative header effect.

Thank you
